

High-precision measurement systems for energy, environmental, and industrial applications

Laser Doppler Velocimeter (LDV)

Particle Velocity and Turbulence Measurements

Compact optical transceiver

Built-in high power DPSS lasers

Free-space optics; eliminates optical fibers

FFT based signal processing

LDV-200TRX

Artium Technologies Inc. continues to advance the state-of-the-art in Laser Doppler Velocimeter (LDV) instrumentation. Artium's LDV systems offer turnkey operation with a fully automated setup feature. The optical transceiver can be used for the real-time, non-intrusive measurement of individual particle velocity and turbulence measurement (1 or 2 velocity components) in a variety of flow applications. An optional 1-D transceiver can be used along with the 2-D transceiver for the simultaneous measurement of 3- components of velocity.

The complete instrument includes an optical transceiver, ASA signal processors, data management computer and the AIMS system software. The high powered DPSS lasers built into the transmitter provide stability, compactness, ruggedness, and high reliability; it eliminates the need for inefficient and unreliable fiber optics and bulky Ar-ion lasers.

The Fourier transform based **Advanced Signal Analyzer (ASA)** incorporates a proprietary digital signal burst detection technique and adaptive Doppler burst sampling approach to provide high accuracy in signal detection and measurement.

The Automated Instrument **Management System (AIMS)** provides fully automatic setup and operation of the instrument. A variety of standard and user -configurable views are available to analyze the data. It also offers remote operation and monitoring via the Internet.

The compact LDV design incorporates several features aimed at ease-of-use and data accuracy.

A new version of the ASA is now available featuring further improvement of data accuracy at high speeds and in difficult environments. The AIMS software includes an auto-setup feature that automatically selects the processor and optics settings for optimal performance in complex flows.

Technical Specifications

LDV-200TRX		
	Velocity measurement range	-400 to 1200 m/s
	Velocity accuracy	+/- 0.1%
	Transceiver focal length	100 mm, 200 mm, 350 mm, 500 mm, 750mm, 1000 mm, or 2000 mm
	Laser type	Diode pumped solid state (DPSS)
	Wavelength	491 nm, 532 nm, 561 nm, 660 nm

Signal Processing (ASA)		
Maximum Input Frequency	200 MHz	
Processor bandwidth		
Input voltage	200 μV to 1V	
Minimum transit time	·	
Max sampling frequency	Quadrature, 320 MHz	
Measurement resolution	0.01% of the sampling frequency (frequency)	
Minimum SNR	-6 dB	
Maximum data rate	>250,000 per second	
Number of ADC samples	Adaptive 16 to > 100,000 quadrature	
Burst detection	Frequency domain burst detector Quadrature analog burst detector	
Run time	64 bits, 0.5 μs resolution	
Transit time	32 bits, 0.1 µs resolution	
High pass filters	10 MHz	
Low pass filters	8 filters, software selectable, 100 KHz to 80 MHz	
Mixers	Variable (10MHz to 45 MHz) , 80 MHz	
Bragg cell driver (frequency shift)	40 or 45 MHz, 0.5V into 50 Ohm	
Coincidence	Hardware, Software	
External Input	One analog signal and one 16-bit digital signal may be synchronized with data collection	
PC Interface	Optical Link	

Typical Measurement Ranges

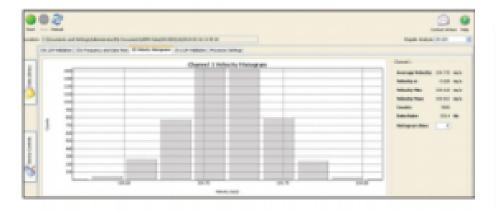

Transceiver Focal Length	Velocity	Range (m/s)
mm	min	max
350	-70	200
500	-100	300
750	-150	450
1000	-200	600
2000	-400	1200

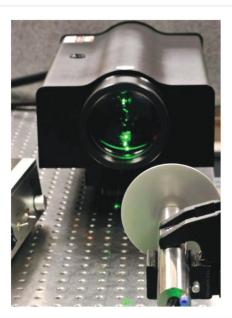

80mm Beam Separation

Parameters that affect the measurement of velocity with the LDV method are laser beam wave length, intersection angle and signal processing electronics. The laser beam intersection angle is often measured in the factory by projecting the beams to a distant wall and measuring the distance to the surface and the spacing between the beams. This method of calibration has been shown to have less than 0.2% measurement uncertainty. For improved accuracy (lower uncertainty), a spinning disk apparatus is generally used. With this approach, a carefully machined and balanced metal disk is used. The disk has a small aperture in it at a radius known to within +/-0.01 % uncertainty. For backscatter LDV Transceiver calibration, a glass bead attached to a fine needle is used.

The National Institute of Standards and Technology (NIST) in the US currently uses an Artium LDV system as a standard reference for air velocity sensors.

Spinning Disk Calibration

Key Features:

OPTICS

- Free-space optics; eliminates need for polarization preserving fiber optics and fiber coupler;
 more efficient power delivery
- High power (300 mW, 500 mW or 1W) diode pumped, solid state (DPSS) lasers packaged inside optical transceiver
- Photomultiplier tubes with pre-amplifiers built into optical transceiver

SIGNAL PROCESSOR

- · Digital frequency domain burst detection
- Variable down mixing, automatically selectable
- Full complex Fourier Transform for measuring velocity (Doppler frequency), up to 16,384 frequencies used
- Complex quadrature sampling
- Sampling frequency as high as 320 MHz; option to go as high as 800 MHz

SOFTWARE

- Auto setup of signal processor (sampling rate, analog filters, down mixing frequency, burst detection)
- Auto high voltage setting
- Software based Fourier transform processing and signal validation
- Configurable data views
- Remote control and data analysis

Artium Technologies, Inc. is committed to supporting its clients through:

- On-site installation
- Product Quality
- Training and Support
- Field service
- Warranty support
- Custom configuration on demand

US Patents: 7, 126, 694 B1, 7, 564, 564 B2, 7, 788, 067 B2, 8, 525, 093 B2 EPO Patent: EP 1 855 081 B1

Our offices, research facilities, and manufacturing plant are located in Sunnyvale, California, where we serve our North American customers. Our distributor partners provide valuable services to our customers in other parts of the world.
